Note reference legend

Note 100: Alarm - State values
State=01: Alarm OFF
State=02: Alarm ON
State=03: Alarm was ON
State=04: Acknowledged, alarm ON
State=05: Acknowledged, alarm was ON
State=06: Reset alarm

Note 101: Alarm - Flag bit status
Bit=00: Internal use (Alarm is OFF)
Bit=01: Alarm is ON
Bit=02: Alarm is ON, input was ON
Bit=03: Alarm is acknowledged
Bit=04: Alarm is acknowledged, input was ON
Bit=08: Input is ON
Bit=09: Internal use (Acknowledged)
Bit=10: Internal use (Siren ON)
Bit=11: Reset is active
Bit=12: Test input: force ON
Bit=13: Test input: force OFF
Bit=14: Reset is active, reset timer is running
Bit=15: Siren is active, siren timer is running
Bit=16: Internal use (Ack request)
Bit=17: Internal use (Auto reset)
Bit=18: Internal use (Siren latched)
Bit=19: Internal use (Siren timeout)
Bit=20: Internal use (Pulse reset)

Note 102: Alarm - Action values
Action=00:
Action=01: Alarm acknowledgement
Action=02: Reset (ignore timer)
Action=03: Reset ON
Action=04: Reset ON with timer
Action=05: Reset OFF
Action=06: Reset ON/OFF toggle
Action=07: Reset ON with timer/OFF toggle
Action=08: Test alarm signal ON
Action=09: Remove test alarm signal ON
Action=10: Test alarm signal ON (activate/deactivate)
Action=11: Test alarm signal OFF
Action=12: Remove test alarm signal OFF
Action=13: Test alarm signal OFF (activate/deactivate)

Note 116: Counter - State values
State=01: Enabled (adjustable value unfrozen)
State=02: Disabled (adjustable value frozen)

Note 117: Counter - Flag values
Bit=00: Freeze

Note 118: Counter - Action values
Action=00:
Action=01: Increase adjustable value
Action=02: Decrease adjustable value
Action=03: Set adjustable value
Action=04: Reset adjustable value (set default value)
Action=05: Freeze adjustable value
Action=06: Unfreeze adjustable value
Action=07: Freeze/Unfreeze adjustable value toggle
Action=08: Reset rollover counter value

Command actions 01, 02, 03 should be combined with the register “Command argument”.

Example: increase by two the total value of the counter function
Set Modbus register “Command argument” to 0x02
Set Modbus register “Command Action” to 0x01

Note 153: Zone temperature - State values
State=01: Not controlling
State=02: Controlling heating
State=03: Controlling cooling
State=04: Controlling
State=05: Not controlling (Disable activated)
State=06: Controlling heating (Disable activated)
State=07: Controlling cooling (Disable activated)
State=08: Controlling (Disable activated)

Note 154: Zone temperature - Flag bit status
Bit=00: Heating control is running
Bit=01: Cooling control is running
Bit=02: Automation disable is ON
Bit=03: No localization available for: Function.TemperatureZone.LiveIcon.TimerDisable

Note 155: Zone temperature - Action bit commands
Bit=00: Heating activation
Bit=01: Heating deactivation
Bit=02: Heating toggle activation / deactivation
Bit=03: Heating set point selection
Bit=04: Set Heating SP1
Bit=05: Set Heating SP2
Bit=06: Set Heating SP3
Bit=07: Add offset to Heating set points
Bit=08: Heating fan speed mode
Bit=09: Activate Heating Force ON
Bit=10: Deactivate Heating Force ON

Bit=11: Heating force ON toggle activation / deactivation
Bit=12: Activate Heating Force OFF
Bit=13: Deactivate Heating Force OFF
Bit=14: Heating force OFF toggle activation / deactivation
Bit=15: Cooling activation
Bit=16: Cooling deactivation
Bit=17: Cooling toggle activation / deactivation
Bit=18: Cooling set point selection
Bit=19: Set Cooling SP1
Bit=20: Set Cooling SP2
Bit=21: Set Cooling SP3
Bit=22: Add offset to Cooling set points
Bit=23: Cooling fan speed mode
Bit=24: Activate Cooling Force ON
Bit=25: Deactivate Cooling Force ON
Bit=26: Cooling force ON toggle activation / deactivation
Bit=27: Activate Cooling Force OFF
Bit=28: Deactivate Cooling Force OFF
Bit=29: Cooling force OFF toggle activation / deactivation

It’s possible to execute multiple action commands at the same time by writing consecutive HR registers (function code 16); if the registers to be changed are not consecutive, it’s necessary to send two commands as shown in the examples below.

Example 1: select heating set point OFF
Write 1 in the Modbus register “command heating setpoint selection” (Function code 6)
Write 8 (bit 3) in the Modbus register “command action” (Function code 16)

Example 2: select heating set point 2 (HSP2)
Write 3 in the Modbus register “command heating setpoint selection” (Function code 6)
Write 8 (bit 3) in the Modbus register “command action” (Function code 16)

Example 3: set value to heating set point 1 (set 21,5 °C)
Write 215 in the Modbus register “command set heating setpoint 1” (Function code 6)
Write 16 (bit 4) in the Modbus register “command action” (Function code 16)

Example 4: set value to heating set point 2 (set 19 °C)
Write 190 in the Modbus register “command set heating setpoint 2” (Function code 6)
Write 32 (bit 5) in the Modbus register “command action” (Function code 16)

Example 5: add 2°C offset to all heating setpoints
Write 20 in the Modbus register “command add offset to heating setpoints” (Function code 6)
Write 128 (bit 7) in the Modbus register “command action” (Function code 16)

Example 5: Select speed AUTO for fan coil (heating)
Write 1 in the Modbus register “command heating fan speed mode” (Function code 6)
Write 256 (bit 8) in the Modbus register “command action” (Function code 16)

Example 6: Activate force ON (heating)
Write 512 (bit 9) in the Modbus register “command action” (Function code 16)

Example 7: Deactivate force ON (heating)
Write 1024 (bit 10) in the Modbus register “command action” (Function code 16)

Note 156: Zone temperature - Disable automation commands
Disable=01: Disable ON
Disable=02: Disable ON + Timeout
Disable=03: Disable OFF
Disable=04: Disable ON/OFF Toggle
Disable=05: Disable ON/OFF Toggle + Timeout

Example 1: disable the automations for the temperature zone function
Write 2 in Modbus register “Command Disable” (Function code 6)

Example 2: toggle disable/enable automations for the temperature zone function
Write 4 in Modbus register “Command Disable” (Function code 6)

Note 157: Zone temperature - Activate Set point commands
Set=01: OFF
Set=02: S1
Set=03: S2
Set=04: S3

Note 158: Zone temperature - Fan coil commands
Mode=01: Auto
Mode=02: Speed 1
Mode=03: Speed 2
Mode=04: Speed 3
Mode=05: OFF

Note 159: Zone temperature - Control state values
State=01: Control is OFF
State=02: Controlling Set Point 1 - Status is OFF
State=03: Controlling Set Point 1 - Status is ON
State=04: Controlling Set Point 2 - Status is OFF
State=05: Controlling Set Point 2 - Status is ON
State=06: Controlling Set Point 3 - Status is OFF
State=07: Controlling Set Point 3 - Status is ON
State=08: Controlling manual set point - Status is OFF
State=09: Controlling manual set point - Status is ON
State=10: Safe mode is active forcing OFF status
State=11: Safe mode is active forcing ON status
State=12: Antifreeze Control is forcing ON status
State=13: Auxiliary Control is forcing ON status
State=14: ON status is forced
State=15: Antifreeze Control is forcing ON status
State=16: OFF status is forced
State=17: System Function Control is forcing OFF status

Note 160: Zone temperature - Control flag values
Bit=00: Set Point OFF
Bit=01: Set Point S1

Bit=02: Set Point S2
Bit=03: Set Point S3
Bit=04: Set Point manual
Bit=05: Safe mode is active - OFF state
Bit=06: Safe mode is active - ON state
Bit=07: Control Status in ON
Bit=08: Antifreeze Control is forcing ON state
Bit=09: Auxiliary Control is forcing ON
Bit=10: Forced ON
Bit=11: Auxiliary Control is forcing OFF
Bit=12: Forced OFF
Bit=13: System Function Control is forcing OFF

Note 161: Zone temperature - Set Point Selected

State=01: OFF
State=02: SP1
State=03: SP2
State=04: SP3
State=05: Manual

Note 164: Zone temperature - Control Mode values

Mode=01: Comparator
Mode=02: PID

Note 167: Zone temperature - Safe Mode values

Value=01: None
Value=02: Turn output OFF
Value=03: Recycle output

Modbus slave Map

Local calendar settings

The mapping of the calendar activities of each function is carried out through a virtual memory, which is reserved to each function with a/including local calendar.
Each function has a dedicated local calendar register that points to a different virtual memory area from the other functions: the memory area size varies according to the number of activities defined in the local calendar and according to the type of function where the local calendar is used.

UWP memory map

Variable name	Function code	Data type	Reg Add (dec)
Command	HR 0x03	Uint16 (1 word)	0
Timer OFF	HR 0x03	Unit32 (2 words)	1
Timer disable	HR 0x03	Unit32 (2 words)	3
Local calendar	HR 0x03	Uint16 (1 word)	5
...	...	...	...
...	...	...	...
...	...	...	...
...	...	...	...

Local calendar virtual map

Reg Add (dec)	Info	Description	Size
0	Header	Number of virtual calendar words	1 word
1		Calendar activities number	1 Word
2		Single activity dimension	1 Word
3		Enable start-up calendar event	1 Word
4	Activity 1	Enable activity	1 Word
5		Day Time (seconds)	2 Words
7		Days (bits)	2 Words
9		Months (bits)	1 Word
10		Week days (bits)	1 Word
11		Action *	N Words
..	Activity n	Enable activity	1 Word
..		Day Time (seconds)	2 Words
..		Days (bits)	2 Words
..		Months (bits)	1 Word
..		Week days (bits)	1 Word
..		Action	N words

Reading commands notes:

1. The starting address it is the real Modbus map one (1 word)
2. By reading one single word from the starting address of the real Modbus map, you will get the total dimension of the virtual map (total number of words for all the local calendar activities)
3. It is not necessary to read all the activities at the same time (you can read N words from the starting address and you will have a partial overview of the virtual map)

Writing commands notes:

1. The starting address it is the real Modbus map one
2. The number of words to be written must be the total dimension of the virtual map (you have always to write the whole map)
3. By writing a single word starting from the Start address of the calendar of the real Modbus map, it is possible to set on/off the “Enable calendar events at start-up” bit of the first 16 activities of the calendar.

Words order for the virtual map:

Register address	Info	Description	Size
0	Header	Number of virtual calendar words	1 word
1		Number of activities	1 Word
2		Single activity dimension	1 Word
3		Enable start-up calendar event	1 Word
4	Activity 1	Enable activity	1 Word
5		Day Time (seconds)	2 Words
7		Days (bits)	2 Words
9		Months (bits)	1 Word
10		Week days (bits)	1 Word

11		Action**	N Words
..			
..	Activity n	Enable activity	1 Word
..		Day Time (seconds)	2 Words
..		Days (bits)	2 Words
..		Months (bits)	1 Word
..		Week days (bits)	1 Word
..		Action**	N words

* *The action register indicates the action to be performed and depends on the function (for example, for a Counter function, the action register consists of 2 words; for a switch function instead, the Action register consist of 1 single word).

Reserved registers

The Modbus map provides a reserved register that contains information about the UWP system status.

Function code	Address (hex/dec)	Format	Value	UWP status description
0x03 HR 0x04 IR	0xFFFF / 65535		0x0101	- Ongoing configuration (busy) - System start-up (busy)
0x03 HR 0x04 IR	0xFFFF / 65535		0x0000	Runtime (ready)
